You have several choices of how to begin your project
1) Select a paper from the *Journal of Economic Perspectives*. Gather data of your own that supports or contradicts the arguments in the paper (perhaps extending the sample period or forming a sample from a different region). You may wish to do this in conjunction with another upper division economics class.

2) Select an economic series of interest to you, either from a firm you work for (or own) or from some other avenue. Model the series and construct predictions for the most recent three year interval.

Regardless of which you choose you select, you need to secure my approval of the project.

You will have 30 minutes to present your findings.
